## UIM342C / UIM342S / UIM342XS Motion Controller for Servo Stepper Motor With CAN Bus Interface

The UIM342 series are advanced motion controllers designed for servo stepper motors, featuring a CAN Bus interface.

These controllers integrate several key functional modules: **Communication Unit / Motion Control Unit / Motor Driver / Feedback Control Unit / Input Logic Control** and **DSP System** (for processing instructions, replying, notifications, coordinating other functional modules, executing preloaded user programs, and providing real-time status updates)

The major control loop is executed within 1 millisecond, ensuring responsiveness.

### Key Features:

- **High-Performance DSP System:** Executes all control loops within 1 millisecond.
- **Comprehensive SDK:** Includes SDK, DLL, LIB, and SO files.
- **Sample Codes:** Available in C++, C#, and other languages.
- **Cross-Platform Support:** Compatible with Linux, Windows 32-bit, and 64-bit systems.

### Control System

- Robust DSP hardware
- Fault tolerance, fail safe user interface
- Input and event change notification

### Motor Driver

- Wide Voltage Input: Operates on 24 ~ 48 VDC<sup>(1)</sup>
- Adjustable Phase Current: Up to 8 A<sup>(1)</sup>
- PWM Constant Current
- Micro-Stepping: 1 ~ 1/64 resolution
- No vibration or noise at low speeds.
- Protection: Overcurrent, overvoltage, overheating, etc.

### Closed-loop Control

- High positioning accuracy, high response, Maximum speed up to 3000 rpm, it's depends on the Motor type
- Speed control, position control
- Backlash Compensation
- Stall detection

#### Note:

(1) Depending on the actual controller.

### I/O Logic Control

- 3 digital inputs
- 1 output port (5V / 50mA)
- 3 trigger types (Continuous/Low-pass Filter/One-time)
- Input change notification
- 11 preset actions can be attached to the I/O port trigger

### CAN Networking

- Active CAN 2.0, 1 Mbps Max.
- 1500V photoelectric isolation
- Support 3 types IDs:

- 1) Node ID
- 2) Group ID
- 3) Global ID

### Other features

- Emergency trigger lockout
- Integrated design with motor
- Aluminum alloy casing, sturdy and durable for easy heat dissipation
- Size as small as 20 mm x 20 mm x 16 mm

# Safety

To prevent personal injury and property damage, please be sure to pay attention to the following before use:

	Precautions	Consequences of Neglect
	Do not use it in humid, corrosive, flammable gas environments or places near flammable substances	Fire / Malfunction
	Do not use the wire when it is soaked in oil/water	Fire / Malfunction
	For motors with shaft keyway, do not touch the keyway with bare hands	Personal injury
	Never touch the rotating parts of a running motor	Personal injury
	Do not touch the running motor, it may be very hot	Personal injury
	Do not cause the wires to be damaged or subjected to excessive external force, heavy pressure, or clamping	Fire / Malfunction
	Do not hold the cable or motor shaft when transporting	Personal injury / Malfunction
	Never hit the motor	Malfunction
	Do not frequently power on / off	Malfunction
	Never modify, disassemble or repair by yourself	Fire / Malfunction / Personal injury
	Power supply voltage must meet the product requirements, and the Power supply current must be 1.5 times larger than the product requirements	Malfunction
	Cut off the power when not in use for a long time	Fire / Malfunction / Personal injury

# Maintenance

Please perform regular maintenance and inspection on the controller for safe use. Please pay attention to the following during maintenance and inspection:

- ① When performing the insulation test on the drive, be sure to disconnect all connections.
- ② Do not use gasoline, thinner, alcohol, acidic and alkaline cleaning agents to avoid damage to the casing.

Daily inspections and periodic inspections should be carried out according to the following items.

Type	Period	Check Item
Daily Inspection	Every day	<ul style="list-style-type: none"><li>• Confirm the operating temperature and humidity</li><li>• No foreign matter entering</li><li>• Abnormal vibration, sound and odor</li><li>• Abnormal power supply voltage</li><li>• Damaged wiring parts</li></ul>
Periodic Inspection	1 year	<ul style="list-style-type: none"><li>• No looseness in the fastening parts</li><li>• Broken terminal blocks and loose fastening parts</li></ul>

# Quick Start

The following explains how to quickly build and run a motor system consisting of 2 servo stepper motors equipped with UIM342 controllers and 1 UIM2513 gateway.

*For the convenience of users, the development kit (UIMEVA\_342KIT) provided by UIROBOT Company includes the experimental materials used in the system (excluding Windows PC).*

- 1) Connect the wiring as shown below. Be sure to check the wiring again before powering on to make sure it is correct.

Figure 0-5: Quick connection diagram

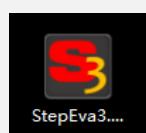

### WARNING

- Avoid using star connections. When the CAN cable length exceeds 20 meters, dedicated CAN cables should be used. The length of branch cable to each node should not exceed 20 cm.
- UIM2513 has a built-in terminal resistor, which can be activated by the toggle switch. It is recommended to connect a 120-ohm terminal resistor to the other end of the CAN cable.
- Strictly avoid hot-plugging while the power is on. Hot-plugging may lead to ground loss (i.e. the power supply V+ is connected while V- is disconnected). In such instances, power V+ will flow into other UIM devices via the CAN cable, causing the burnout of multiple UIM devices.
- Connect all UIM devices to a common ground. Activating a high-power device can raise the voltage on one ground significantly. Without a common ground, this elevated voltage may flow via the CAN cable to the ground of other UIM devices, risking the burnout of multiple devices.

- 2) Download and click to run the Windows based control panel "StepEva3".

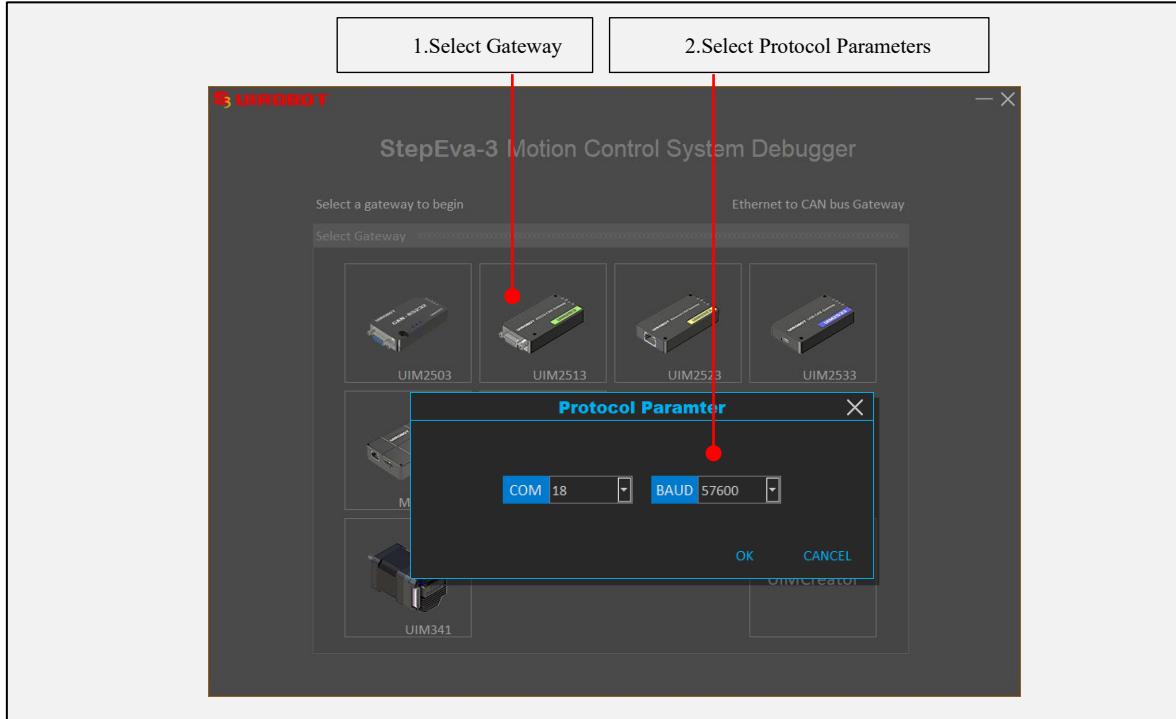

Figure 0-6: Icon of StepEva3

# Motion Controller with CAN Interface

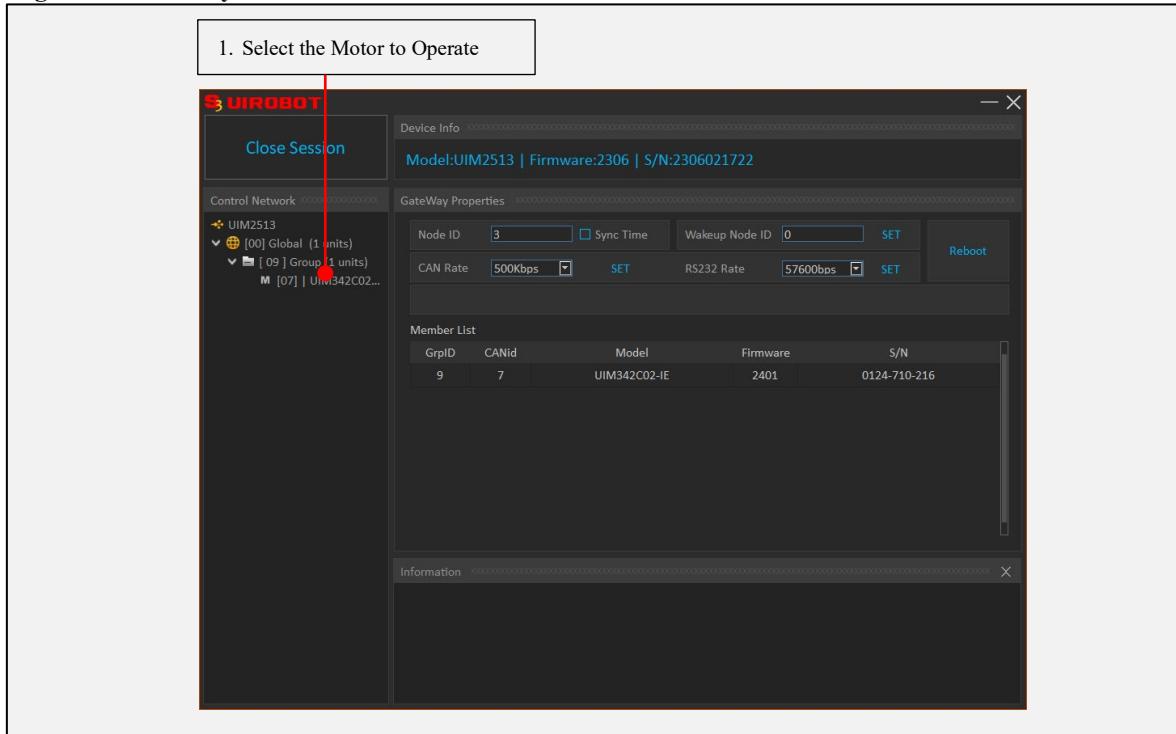

- 3) UIM2513 (RS232 -CAN) should be selected here.

Figure 0-7: Gateway selection screen 2

- 4) Select the UIM342C02-IE to operate in the device list on the left.

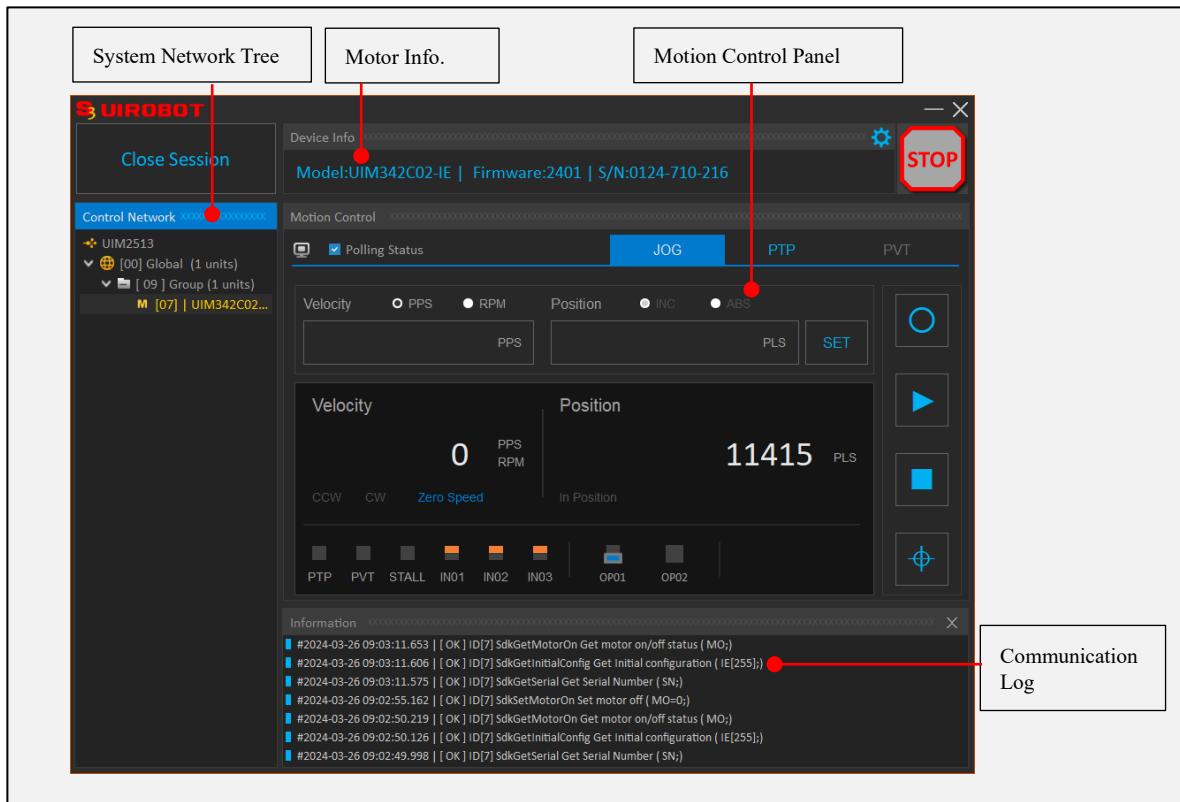

Figure 0-8: Gateway information screen

- 5) Set motion parameters and operate the motor to move.

# Specifications

## Absolute Maximum Ratings

Ambient temperature under bias.....	-40 °C to 85 °C
Storage temperature .....	-65 °C to +150 °C
Voltage on V+ with respect to V- (UIM342XS / 342S).....	10 V to 36 V
Voltage on V+ with respect to V- (UIM342C).....	10 V to 36 V
Voltage on V+ with respect to V- (UIM342H).....	20 V to 36 V
Voltage on input ports with respect to V- .....	-0.3 V to 5.3 V
Maximum current sourced by output port.....	100 mA
CANH /CANL voltage with respect to V-.....	- 40 V to + 40 V

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

## Operating Conditions (at ambient temperature 25 °C)

	Specification		
	UIM342XS/342S	UIM342C	UIM342H
Supply Voltage (DC)	10V– 28V	20V-40V	20V-50V
Driver Capacity	Peak 1 / 2 / 4 / 8 Amp		
Current Control	PWM constant current		
Micro-Stepping	full, 1/2/4/8/16/32/64		

## Operating Environment

Cooling	Free Air
Environment	Avoid dust, oil mist and corrosive gases
Operating temperature	-40 °C ~85 °C
Humidity	< 80% RH, no condensation, no frost
Vibration	3 G Max
Storage	-65 °C ~ 150 °C

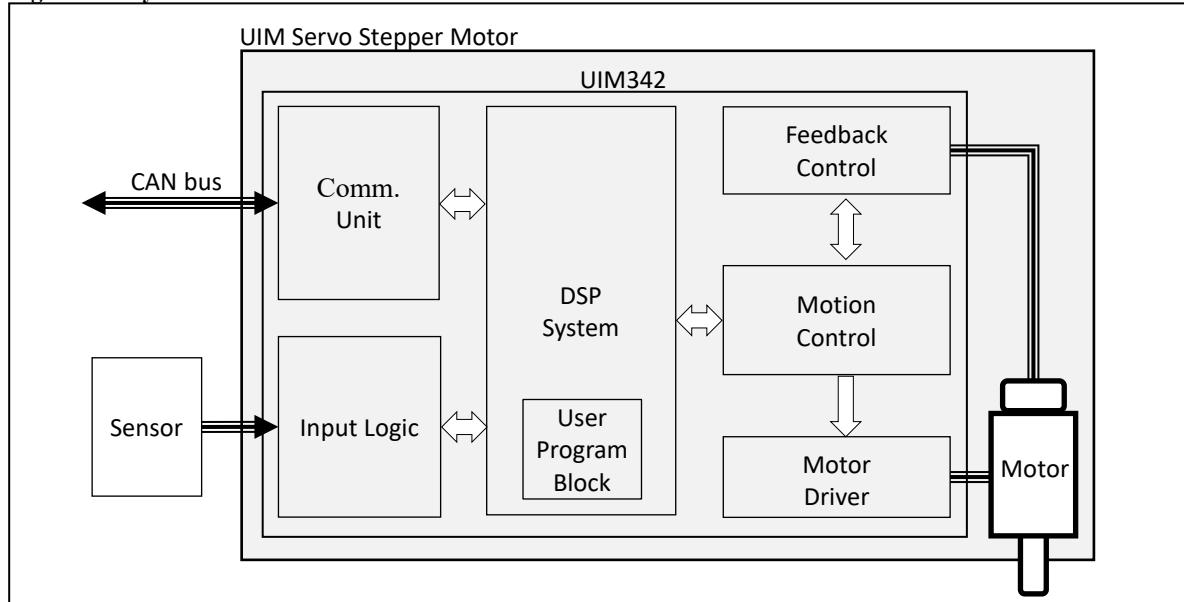

## Communication Interface

CAN	Active CAN 2.0
CAN Physical	Two-wire system, CANH, CANL, twisted pair
CAN Driver	<ul style="list-style-type: none"><li>• Max. 1 Mbps</li><li>• Meets ISO-11898 standard physical layer requirements.</li><li>• Differential bus</li></ul>

## 1.0 Introduction

UIM342 motion controller can realize open-loop control or closed-loop control. Its main functional modules include: Communication Unit, Motion Control Unit, Motor Driver, Feedback Control Unit, Input Logic Control and DSP System (processing instruction / reply / notification, and coordinating other functional modules, executing preloaded user programs and real-time status notifications, etc.). All control loops are completed within 1 millisecond.

**Figure 1-1: System functional structure**

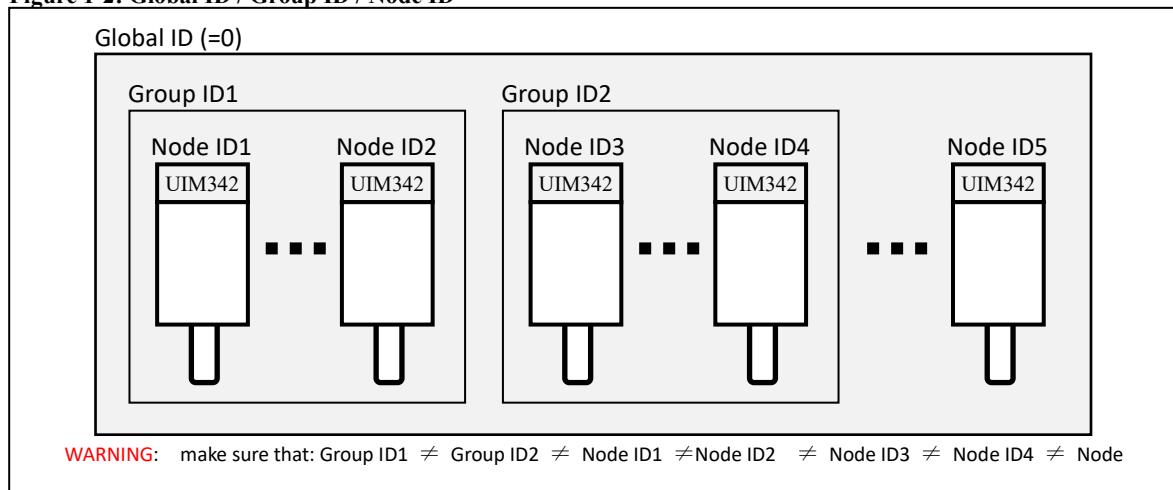

### 1.1 Communication Unit

Active CAN 2.0 B hardware and software is used, and CAN bit rate is configurable from 125 K to 1000 Kbps by instructions.

To improve the coordination performance of multi-modules, UIM342 supports 3 types of CAN ID: Global ID (=0), Group ID and Node ID. The Group ID and Node ID are configurable via instructions. UIM342 will accept the message that has a CAN ID matches any one of the three IDs.

**Figure 1-2: Global ID / Group ID / Node ID**

# **UIM342C/UIM342S/UIM342XS**

---

## **1.2 Motion Control**

Contains hardware and software for speed control and position control in open-loop or closed-loop modes.

In addition of normal functions like speed, relative position, absolute position, UIM342 also provides functions such as backlash compensation and automatic reciprocating oscillation to facilitate medical device's needs.

## **1.3 Motor Driver**

Supports 1/2/4/8/16/32/64 micro-stepping, with almost no vibration/noise when running at low speed.

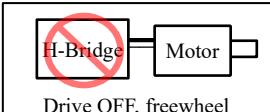

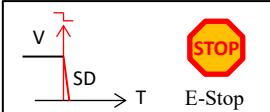

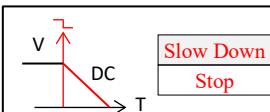

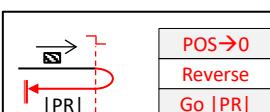

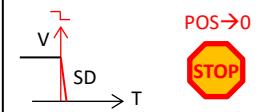

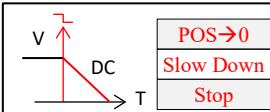

In the low-speed range, compared with AC and DC servo systems, the UIM342 Servo Stepper Motor has higher torque, smaller size, and excellent cost effectiveness.

## **1.4 Input Logic Control**

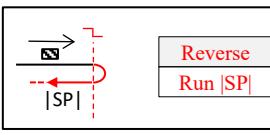

UIM342 supports 3 digital inputs. User can configure the actions to be performed on the logic level change.

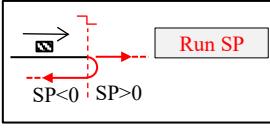

There are total 6 motion parameter sets. Each input port has 2 sets of motion parameters, one for rising edge, and another for falling edge. Each motion parameter set includes: acceleration AC and deceleration DC, +/- speed SP, +/- displacement PR, +/- position PA.

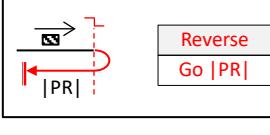

There are 11 functional behaviors that can be attached to the rising/falling edge of the inputs:

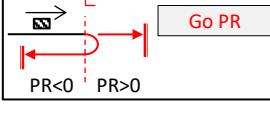

- 1)   
Drive OFF, freewheel
- 2)   
Emergency stop (using SD)
- 3)   
Decelerating to stop (using DC)
- 4)   
Set origin then go reversed relative position (using |PR|, SP, AC, DC)
- 5)   
Set origin then Emergency stop (using SD)
- 6)   
Set origin then decelerate to stop (using DC)

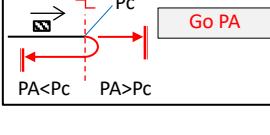

# Motion Controller with CAN Interface

- 7) 

Reversed Jog (using  $|SP|$ , AC, DC)
- 8) 

Jog (using SP, AC, DC)
- 9) 

Go reverse relative position (using  $|PR|$ , SP, AC, DC)
- 10) 

Go relative position (using PR, SP, AC, DC)
- 11) 

Go absolute position (using PA, SP, AC, DC)

## 1.5 Logic after Motor Stall

After “motor stall” is detected, by default, the motor shaft will be stopped and locked.

However, set “**IL[16] =1**” will change the logic to “turn motor driver off (freewheel)” after a “stall” situation is detected.

## 1.6 Real Time Notification

UIM342 can automatically send messages to the user after detecting the occurrence of a preset event. The time from detection to event occurrence to feedback is less than 1 millisecond.

UIM342 supports real-time notification for following events:

- Reach desired position (in PTP mode),
- Rising edge and falling edge of input 1, 2, and 3,
- Detection of motor stall, and
- Other alarm/warnings.

## 1.7 System development SDK

The instruction set for UIM342 motion controller is simple and highly fault-tolerant. If an incorrect command is entered, the motion controller will return an error message to the host computer. Wrong instructions are not executed to avoid accidents.

UIROBOT Company provides free System Development Kit (SDK), and provides free C++ and C# software control demonstration source code and demonstration software based on Visual studio.

Meanwhile, UIROBOT provides R&D services for user control system solution development.

## 1.8 Connect to User Devices

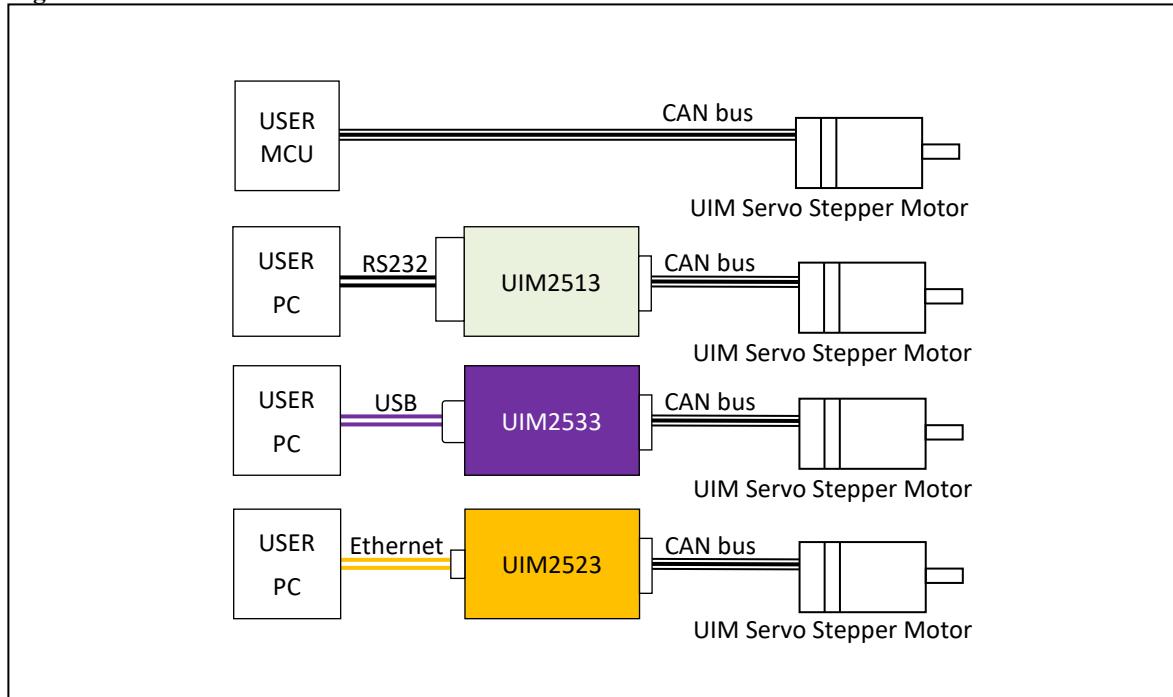

There are 4 ways to connect the UIM342 to the user devices, as shown in Figure 1-3:

## **UIM342C/UIM342S/UIM342XS**

---

- 1) Directly through CAN Bus if the user controller has a CAN port;
- 2) Using the UIM2513 RS232-CAN gateway (sold separately);
- 3) Using the UIM2533 USB-CAN gateway (sold separately);
- 4) Using the UIM2523 Ethernet-CAN gateway (sold separately).

**Figure 1-3: Connect to User Devices**

## 2.0 Protocol

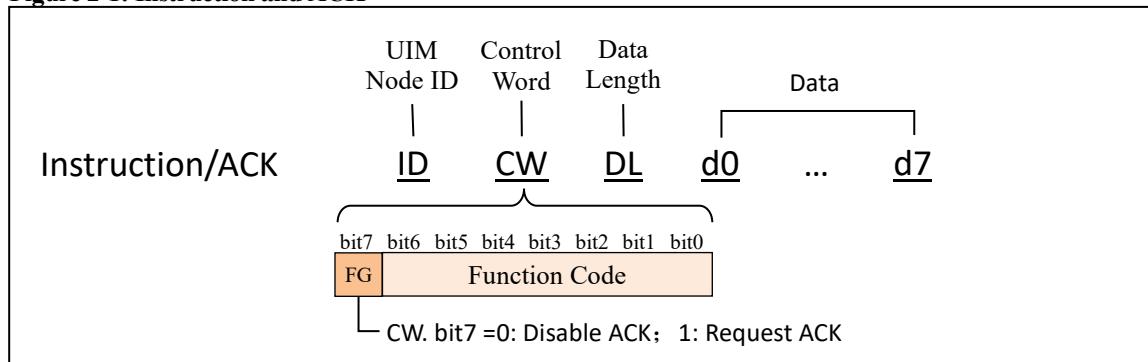

This section introduces the instructions, reply / ACK, error reporting, and real-time status and alarm notifications supported by UIM342.

### 2.1 Instruction and Reply (ACK)

**Instruction** is the commanding message sent from the user computer to the UIM342. Before receiving an instruction, UIM342 will not act.

**ACK** is a feedback sent from UIM342, after receiving an instruction. For setup instruction, the ACK message is typically a repeat of the instruction; for query instruction, the ACK message provides the queried data.

Figure 2-1: Instruction and ACK

**ID** Device ID (1 byte), could be one of 3 types as listed below:

- 1) UIM342 Node ID (configurable via instruction),
- 2) Group ID of UIM devices (configurable via instruction), or
- 3) Global ID = 0, fixed.

**CW** Control Word (1 byte):

- 1) CW.bit <6:0> is the function code (0x00...0x7F);
- 2) For instructions,
  - CW.bit7 = 1, ACK is expected;
  - CW.bit7 = 0, No ACK needed.
- 3) For ACK, CW.bit7 is fixed to 0.

**DL** Valid number of bytes of data (1 byte).

**d0...d7** Data bytes, least significant byte first.

# UIM342C/UIM342S/UIM342XS

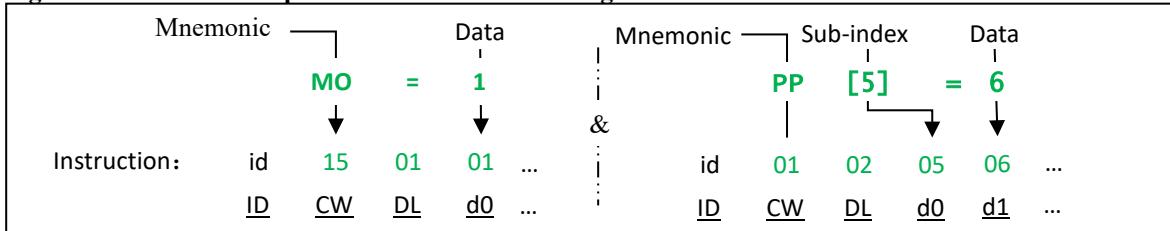

## 2.2 Mnemonic

For user convenience, UIM products provide a set of mnemonics used to represent various instruction codes. For example:

Mnemonic	CW	Function
MO	0x15	Turn on/off motor drive

The relation between mnemonic expressions and instructions is shown below:

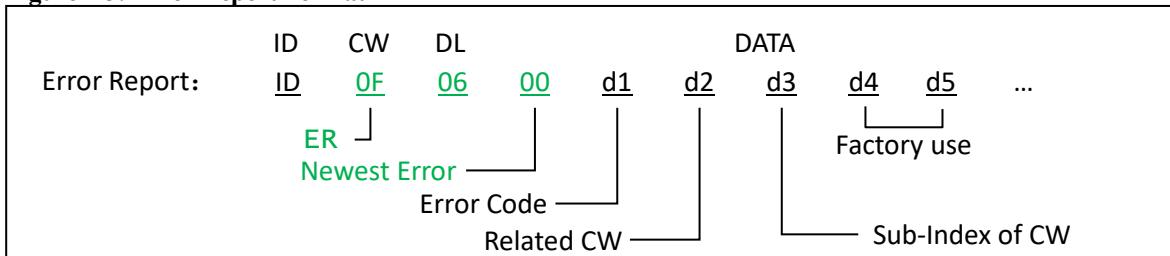

Figure 2-2: Mnemonic Expression & Instruction Message

## 2.3 Error Report

When UIM342 receives a wrong instruction, it will not execute the instruction, instead, it will reply an error message. Meanwhile, users can use ER[i] to get the latest error and the previous 7 historical errors. The format of an error message is listed below:

Figure 2-3: Error Report Format

d1      Error Code;

Error Code for UIM342	Description
0x32	Instruction Syntax error
0x33	Instruction Data error
0x34	Instruction Sub-Index error
0x3C	SD value is less than DC value
0x3D	Current instruction is not allowed when motor is running
0x3E	BG is not allowed when motor driver is OFF
0x3F	BG is not allowed during emergency stopping
0x41	OG is not allowed when motor is running

d2      CW related to the error, e.g., d2 = DI indicates an error on previous DI instruction.

d3      Sub-Index of the CW related to the error, e.g., d2= PP; d3 = 5 indicates an error on previous PP[5] instruction.

d4, d5      Factory use, don't care.

# Motion Controller with CAN Interface

## 2.4 Real-Time Status and Alarm Notification

Real-time notifications are messages the UIM controller automatically sends to the user device, including execution status, alarms, and I/O port level change notifications.

UIM342 is equipped with a notification/information enable configuration register. Some real-time notifications can be enabled / disabled by setting this register. The notification enable register is read and written by the instruction **IE[i]**. Refer to “5.3 IE[i] Information Enable” for details.

The real-time status notification format sent by UIM342 to the user is as follows:

**Figure 2-4: Real-time Notification**

Real Time Notification	<u>ID</u>	<u>5A</u>	<u>DL</u>	<u>d0</u>	<u>d1</u>	...	<u>d7</u>
------------------------	-----------	-----------	-----------	-----------	-----------	-----	-----------

Types of notifications are shown in the table below: (The message examples are all assumed to be produced by site 5(ID=5))

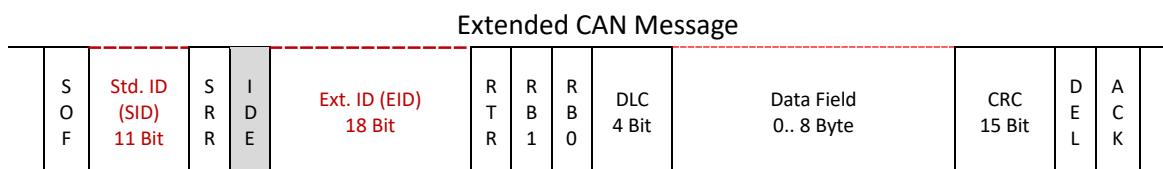

d0	d1	Type	Notification message example	Remark
-	-	-	ID CW DL d0 d1 d2 d3 d4 d5 d6 d7	-
0	0x0A	Alarm	05 5A 05 00 0A 00 00 00 00 00 00 00	System emergency stop and lock
0	0x19	Alarm	05 5A 05 00 19 00 00 00 00 00 00 00	Speed over limit
0	0x1A	Alarm	05 5A 05 00 1A 00 00 00 00 00 00 00	Exceed Lower Working Limit
0	0x1B	Alarm	05 5A 05 00 1B 00 00 00 00 00 00 00	Exceed Upper Working Limit
0	0x1D	Alarm	05 5A 05 00 1D 00 00 00 00 00 00 00	Motor Stall Detected
0	0x1E	Alarm	05 5A 05 00 1E 00 00 00 00 00 00 00	Encoder Error
0	0x1F	Alarm	05 5A 05 00 1F 00 00 00 00 00 00 00	Encoder Battery Low
0x01	0	Status	05 5A 01 01 00 00 00 00 00 00 00 00	Input 1 falling edge detection
0x02	0	Status	05 5A 01 02 00 00 00 00 00 00 00 00	Input 1 rising edge detection
0x03	0	Status	05 5A 01 03 00 00 00 00 00 00 00 00	Input 2 falling edge detection
0x04	0	Status	05 5A 01 04 00 00 00 00 00 00 00 00	Input 2 rising edge detection
0x05	0	Status	05 5A 01 05 00 00 00 00 00 00 00 00	Input 3 falling edge detection
0x06	0	Status	05 5A 01 06 00 00 00 00 00 00 00 00	Input 3 rising edge detection
0x29	0	Status	05 5A 08 29 00 00 00 p0 p1 p2 p3	PTP positioning completed, [p3:p0] = current position

# UIM342C/UIM342S/UIM342XS

## 2.5 Direct CAN Communication

When directly communicating with UIM342 devices via CAN Bus, the user CAN controller needs to be configured as follows:

- 1) TQ number, use one of the following options:
  - 1 M bps use 8 TQ;
  - 800 K bps use 10 TQ;
  - Any other bps, use 16 TQ.
- 2) Synchronous jump: 1 TQ.
- 3) Sample once at each sampling time.
- 4) Phase Segment 2: 2 TQ.
- 5) Filter and MASK are configured to receive all messages.
- 6) Set SRR = 1; IDE = 1; RTR = 0; RB1 = 0; RBO = 0;

EID, SID, DLC, and data0...data7 of the CAN message should be processed as follows:

### Sending instructions to UIM342:

```
SID = ((ID<<1) & 0x003F) | 0x0100; //ID (Consumer, UIM's Address)
EID = (((ID<<1) & 0x00C0)<<8) | CW; //CW (Control Word)
DLC = DL; //DL (Effective Data Length)
CANTX_B0 = d0;
CANTX_B1 = d1;
CANTX_B2 = d2;
CANTX_B3 = d3;
CANTX_B4 = d4;
CANTX_B5 = d5;
CANTX_B6 = d6;
CANTX_B7 = d7;
```

Note: Some controllers may use 32bits CAN-ID, which = (SID<<18) | EID;

### Parsing received messages from UIM342:

```
ID = ((EID>>11)&0x0060)|((SID>>6)&0x001F); //ID (Producer, UIM's Address)
CW = EID&0x00FF; //CW (Control Word)
DL = DLC&0x000F; //DL (Effective Data Length)
d0 = CANRX_B0;
d1 = CANRX_B1;
d2 = CANRX_B2;
d3 = CANRX_B3;
d4 = CANRX_B4;
d5 = CANRX_B5;
d6 = CANRX_B6;
d7 = CANRX_B7;
```

Note: Some controllers may use 32bits CAN-ID, which = (SID<<18) | EID;

# Motion Controller with CAN Interface

To help further understanding the CAN protocol (i.e., SimpleCAN3.0) used to control the UIM342, more details and examples are listed below.

## CAN-ID for SimpleCAN3.0

CAN-ID (29bit)																												
SID[10: 0] (11bit)											EID [17:0] (18bit)																	
10	9	8	7	6	5	4	3	2	1	0	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Producer ID [4:0]	Consumer ID [4:0]	0	Producer ID [6:5]	Consumer ID [6:5]	Reserved = 0											Control Word (CW)												

Producer ID	ID of the controller (Master); For user master controller, should use ID = 4.
Consumer ID	ID of UIM342 (Initial ID = 5, range 5...127), can be modified via Instructions.
Control Word	Control Word for UIM342; For instance, CW = 0x95 is to enable the motor driver.

Calculation of SID:

$$\text{SID} = ((\text{Consumer ID} \ll 1) \& 0x003F) | 0x0100;$$

Calculation of EID:

$$\text{EID} = (((\text{Consumer ID} \ll 1) \& 0x00C0) \ll 8) | \text{CW};$$

In case of your controller only supports the CAN-ID (32-bit) format, calculate as follows:

$$\text{CAN-ID} = \text{SID} \ll 18 | \text{EID};$$

## Example

Using a CAN master device with ID 4 to enable (i.e., MO=1;) a UIM342 motor driver with ID 5

Producer ID = 4

Consumer ID = 5

CW = 0x95 (MO)

Data = 1;

Calculate SID:  $\text{SID} = ((5 \ll 1) \& 0x003F) | 0x0100 = 0x010A;$

Calculate EID:  $\text{EID} = (((5 \ll 1) \& 0x00C0) \ll 8) | \text{CW} = 0x0095;$

Calculate CAN-ID:  $\text{CAN-ID} = 0x010A \ll 18 | 0x0095 = 0x04280095;$

DLC = 0x01;

Data0 = 0x01;

Send following message from user controller to UIM342:

CAN-ID (hex)	Date Field(hex)
04280095	01

If the user computer needs to specify DLC, please send following:

CAN-ID (hex)	DLC (hex)	Date Field (hex)
04280095	01	01

# UIM342C/UIM342S/UIM342XS

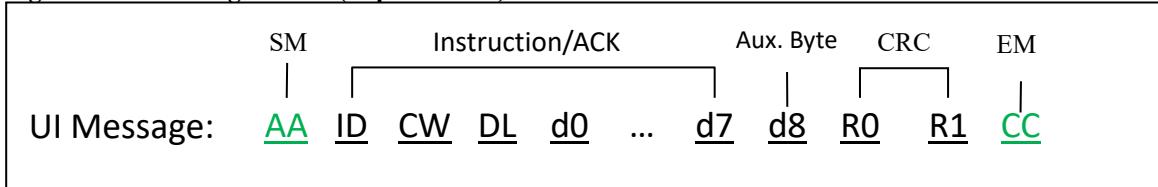

More examples of CAN message used to control the UIM342 motors are listed below.

Can-ID (hex)	Data (hex)	Function
04280095	00	M0 = 0, set drive off
04280095	01	M0 = 1, set drive on
0428009D	10 27	JV = 10000pps, set jog speed 10000pps
0428009D	F0 d8 FF FF	JV = -10000pps, set jog speed -10000pps
04280096	No data	BG, set begin motion
04280097	No data	ST, set stop motion
0428009F	80 0C	PR = 3200
0428009F	80 F3 FF FF	PR = -3200
042800A0	80 0C	PA = 3200
042800A0	80 F3 FF FF	PA = -3200
0428009E	80 0C	SP = 3200

## 2.6 RS232 / USB / Ethernet Gateway

Gateway such as UIM2513, UIM2523, UIM2533 Messages send / receive are all UIMessage format.

Figure 2-6: UIMessage format (requires CRC)

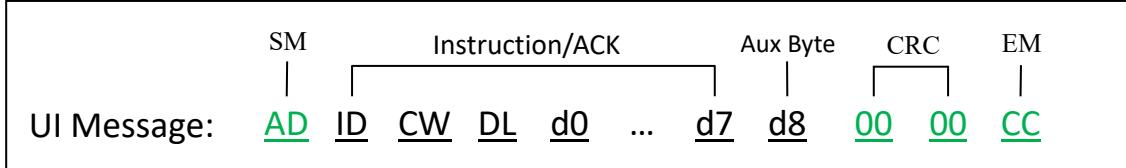

**SM** Start of Message. If need CRC, using **0xAA**, else using **0xAD** instead,

**d8** Auxiliary byte, don't care,

**R1:R0** RTU CRC16, range covers AA...d8, refer to Appendix- 1 for calculation source code,

**EM** End of Message; is fixed to **0xCC**.

Figure 2-7: UI Message format (no CRC)

Notice: UIMessage is in Hex Format, and the length of the message is fixed to 16;

## 3.0 Motion Control

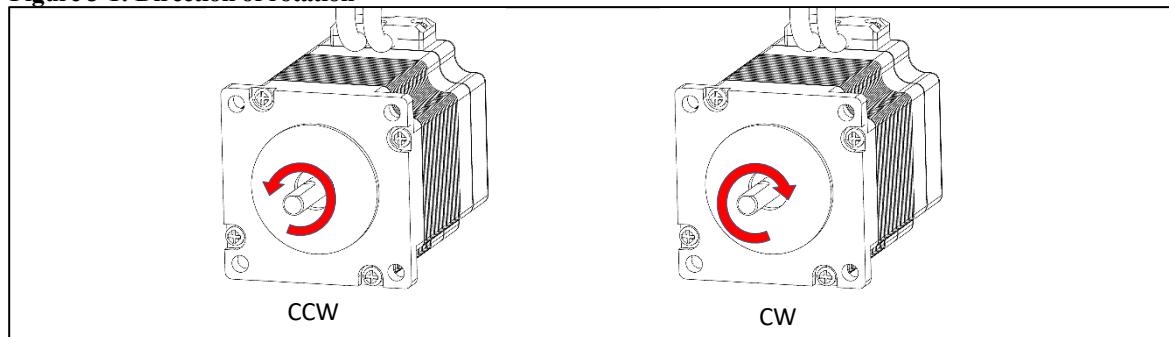

UIM342 motion controller supports speed control mode and point to point (PTP) position control mode. User can Set, Get and Store motion parameters through instructions. Meanwhile, user can also receive the working status of the motor through real-time notification.

This chapter briefs the motion control related functions of UIM342.

### 3.1 Direction of Rotation

Facing the output shaft, direction of the motor rotation is defined as CW if the shaft rotates clockwise, and CCW if the shaft rotates count clockwise.

Figure 3-1: Direction of rotation

Set “IC[1]=1” to configure the position counter increase when the motor is running in CCW direction (Factory default). Otherwise, set “IC[1]=0” to configure the position counter increase when the motor is running in CW direction.

### 3.2 Motion Control Modes

- **Speed control (JOG)**

UIM342 controls the motor speed to reach the desired speed set by the user through an acceleration or deceleration process.

The JV instruction sets the desired speed value, and the sign (+/-) of the value determines the direction of the rotation. In addition, the AC instruction sets the acceleration rate and the DC instruction sets deceleration rate.

**After a JV instruction, the BG instruction must be set to start the movement.** In this manner, multiple UIM342 controllers can be set JV one by one, and start moving at exactly the same time via sending BG to the group ID or the global ID.

- **Position control (PTP)**

UIM342 controls the speed and displacement of the motor and stops when it reaches the desired position. UIM342 approaches the desired speed to the maximum extent while ensuring that the position is accurately reached.

The SP instruction sets the speed used in the position control. The PA instruction sets the absolute position, and the PR instruction sets the relative position with regards to the current position.

**After PA/PR instruction, the BG instruction must be set to start the movement.** In this manner, multiple UIM342 controllers can be set PA/PR one by one, and start moving at exactly the same time via sending BG to the group ID or the global ID.

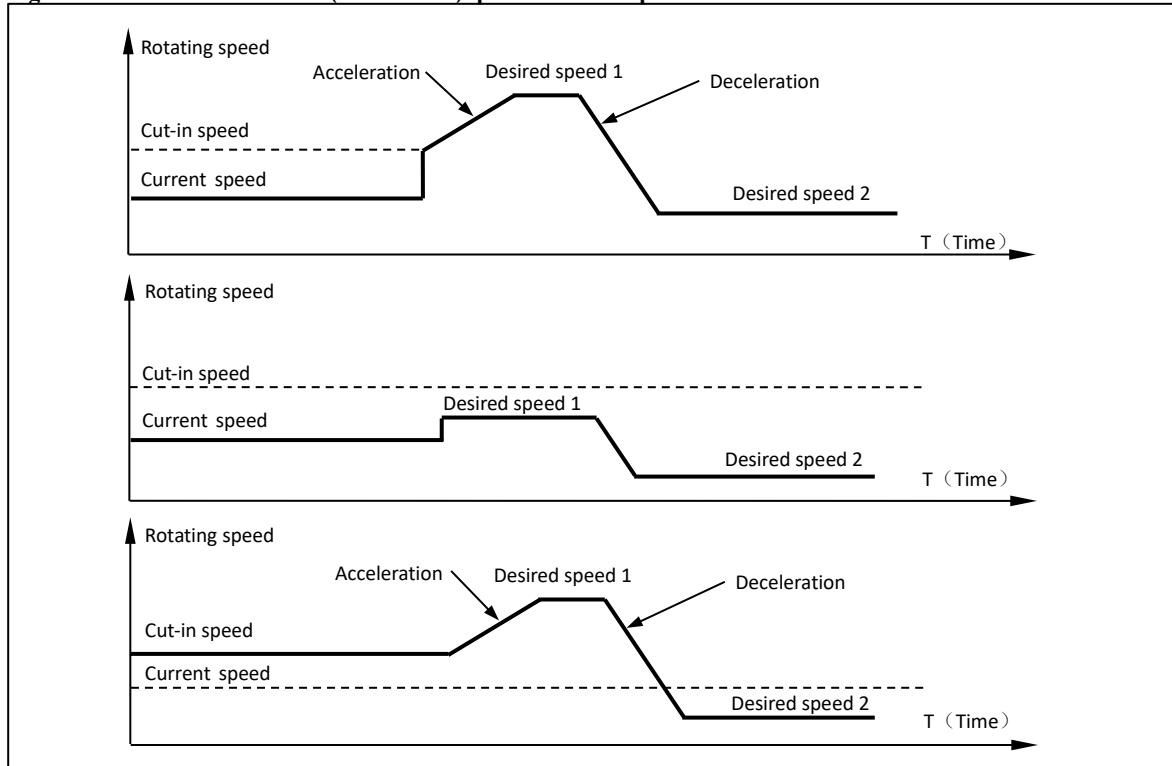

# UIM342C/UIM342S/UIM342XS

Please note, the actual speed/direction of the motor is determined by the position deviation (i.e., desired position - actual position). If the position deviation is too small, the motor may reach the desired position before reaching the desired speed.

## 3.3 Acceleration, Deceleration and Cut-in speed

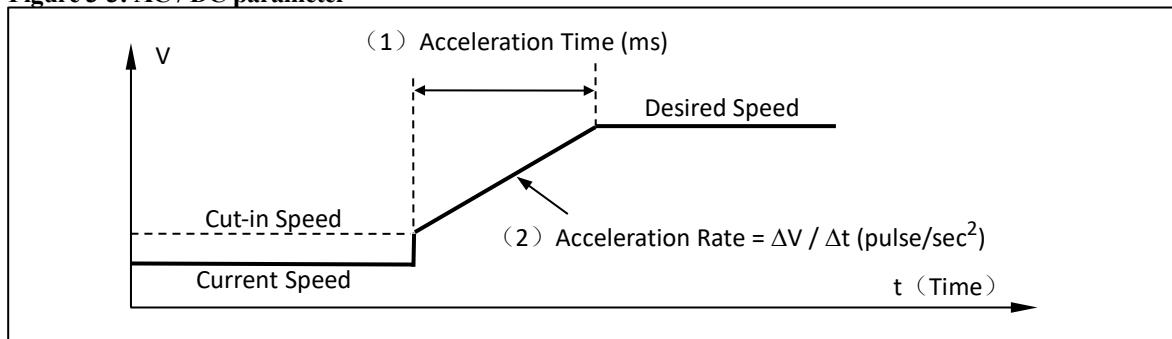

In order to improve the response of the motor and avoid the resonance, the acceleration (deceleration) process includes a cut-in speed.

**Figure 3-2: Uniform acceleration (deceleration) speed and cut-in speed**

Instructions AC, DC, SS are used to set acceleration, deceleration and cut-in speed. Acceleration and deceleration can be defined by the time of the process, or the rate of acceleration and deceleration. The two definitions are shown in the figure below.

**Figure 3-3: AC / DC parameter**

## 3.4 Backlash Compensation

Mechanical systems (such as screw nut transmission or rack and pinion transmission) have backlash problems. For example, there is a certain gap between the screw and the nut. When the forward rotation changes to reverse rotation, within a certain angle, although the screw rotates, the nut still have to wait for the gap to disappear (the side of the force-bearing side has to wait for the gap to

# Motion Controller with CAN Interface

disappear). can drive the workbench to move later. Due to the existence of backlash, when the reverse motion starts, the accumulated error continues to increase and then becomes stable after the backlash is fully compensated.

UIM342 provides a backlash compensation function to reduce the impact of backlash on mechanical transmission accuracy. Use **BL** instruction to set the backlash compensation value.

The unit of backlash compensation setting value is pulse, range (0...65536).

## 3.5 Closed Loop / Open Loop Control

The UIM342 motor controller UIM342 supports both open loop control and closed-loop control.

**Open Loop Control** – Set IC[6]=0 to enable this mode, which operates without feedback.

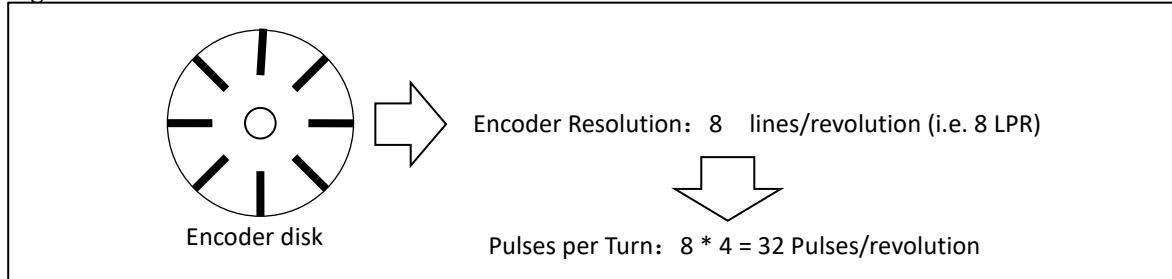

**Closed-Loop Control** - Set IC[6]=1 to activate this mode, where feedback is provided by a quadrature encoder to ensure accurate displacement control.

In the closed-loop control mode, a quadrature encoder is used for displacement feedback, providing more precision in motor positioning.

### Lines per Revolution (LPR)

**LPR** is the number of lines engraved on the encoder's disk. For each full revolution of the motor, the encoder completes one full rotation, generating 4\* LPR pulses.

**Figure 2-5: Encoder LPR**

### Counts per Revolution (CPR)

CPR specifies the number of pulses needed to rotate the motor one full turn. This is essential for closed-loop control in the UIM342, as it determines the pulse requirements for precise positioning. The CPR for the motor is determined by the formula:

$$\text{CPR} = \text{micro-stepping resolution} * 200$$

Where **200** is the number of steps per revolution for a standard stepper motor in full-step mode.

#### [Example Calculation]

For a micro-stepping resolution of 16, the CPR would be:

$$\text{CPR} = 16 * 200 = 3200$$

This means 3200 pulses are required to make the motor complete one full revolution.

## 3.6 Stall Detection

The Stall Tolerance is the maximum allowed difference (pulses) between the encoder feedback and the actual driving pulses sent. When missing steps (pulses) accumulates to the Stall Tolerance, the stall will be detected. UIM 342 will handle the stall detection event.

# UIM342C/UIM342S/UIM342XS

---

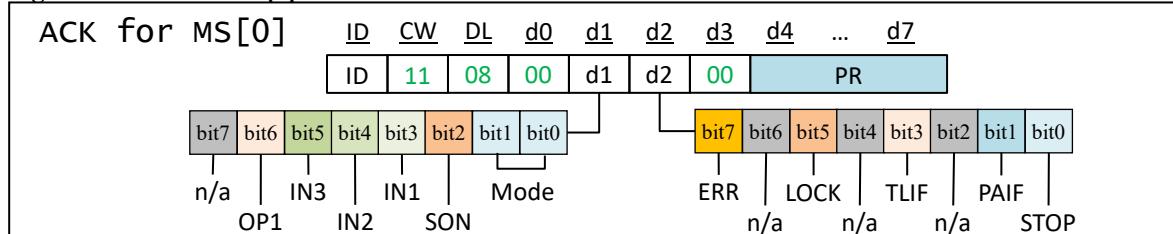

## 3.7 Acquire Motion Status

To facilitate quick query of motion status, the MS [i] instruction can be used as described below.

- **Get Status Flags and Relative Position**

MS [0] is used to get the current motion status flags and the relative position. The ACK message for the MS [0] instruction is explained in the figure below:

**Figure 3-4 ACK for MS[0]**

	name	description	value
d1.bit<1:0>	Mode	motion mode	0 = JOG; 1 = PTP
d1.bit2	SON	motor driver	0 = OFF; 1 = ON
d1.bit3	IN1	IN1 Logic Level	0 = Low; 1 = High
d1.bit4	IN2	IN2 Logic Level	0 = Low; 1 = High
d1.bit5	IN3	IN3 Logic Level	0 = Low; 1 = High
d1.bit6	OP1	OP1 Logic Level	0 = Low; 1 = High
d1.bit7	n/a		0
d2.bit0	STOP	Motor is in stationary	0 = NO; 1 = YES
d2.bit1	PAIF	Motor is in position	0 = NO; 1 = YES
d2.bit2	n/a		0
d2.bit3	TLIF	Motor stall is detected	0 = NO; 1 = YES
d2.bit4	n/a		0
d2.bit5	LOCK	System is locked down	0 = NO; 1 = YES
d2.bit6	n/a		0
d2.bit7	ERR	System error is detected	0 = NO; 1 = YES
d3	n/a		00
d7:d6:d5:d4	PR	Current relative position	Signed 32 bit integer, LSB received first

**Note:** LSB - least significant byte

- **Get Speed and Absolute Position**

MS [1] is used to get the current speed and absolute position.

**Figure 3-5 ACK for MS[1]**

	name	description	value
d3:d2:d1	SP	Current speed	Signed 24 bit integer, LSB received first
d7:d6:d5:d4	PA	Current absolute position	Signed 32 bit integer, LSB received first

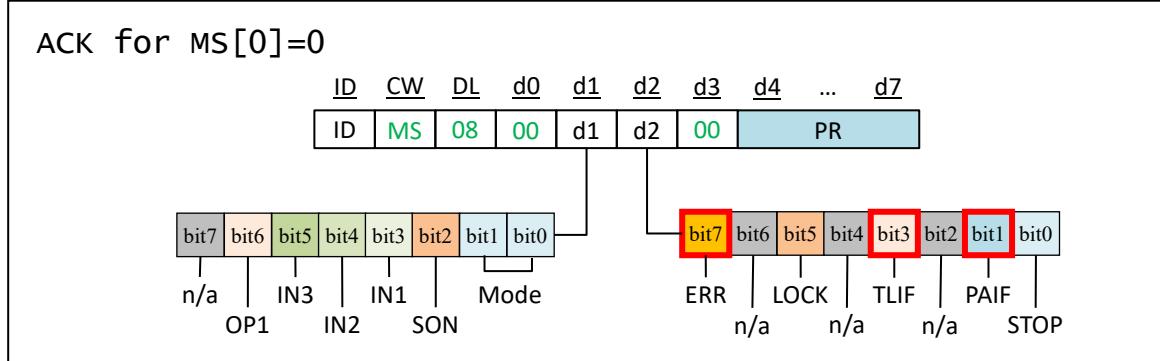

**Note:** LSB - least significant byte

# Motion Controller with CAN Interface

- **Clear Status Flags**

“MS[0]=0” is used to clear the flag bit PAIF, TLIF and ERR. ACK message for the “MS[0]=0” instruction is explained in the figure below (values in the red boxes are cleared):

Figure 3-5 ACK for MS[0]=0

# 4.0 Input Logic Control

The input logic control module has the following functions:

- 1) Processing and reporting the logic levels of input ports,
- 2) Executing the following user preset actions, when the input logic level change is detected:
  - Motor Driver OFF,
  - Emergency stop (using SD),
  - Decelerating to stop (using DC),
  - Set origin then go reversed relative position (using |PR|, SP, AC, DC),
  - Set origin then Emergency stop (using SD),
  - Set origin then decelerate to stop (using DC),
  - Reversed Jog (using |SP|, AC, DC),
  - Jog (using SP, AC, DC),
  - Go reverse relative position (using |PR|, SP, AC, DC),
  - Go relative position (using PR, SP, AC, DC),
  - Go absolute position (using PA, SP, AC, DC).

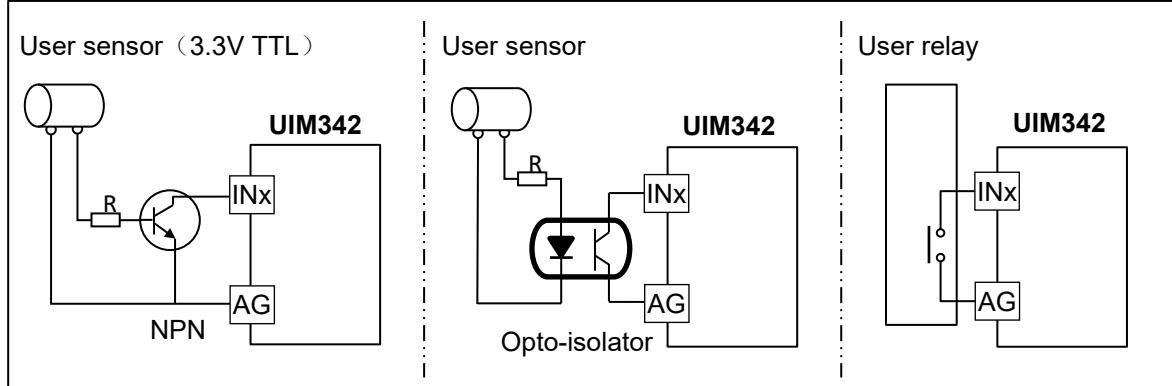

## 4.1 Wiring the Sensor

UIM342 input ports only takes 5V TTL signal.

If a 3.3V TTL sensor is to be used, an NPN transistor should be added as shown in figure 4-1.

It is recommended to use a photoelectric isolation module between the sensor and the INx port of the controller. The photoelectric isolation module has strong anti-interference properties and is recommended for use in factory environments and situations with significant interference. Please adjusting the resistance R to ensure that the current through the isolator is around 10 mA.

Figure 4-1: UIM 342 input port wiring

## 4.2 Trigger modes

The voltage on each input port can be processed with three types of trigger modes:

- **Continuous Trigger Mode**

In this mode, UIM342 continuously samples the voltage on input ports. If a logic level change is detected, UIM342 will immediately notified the user and execute the preset logic actions.

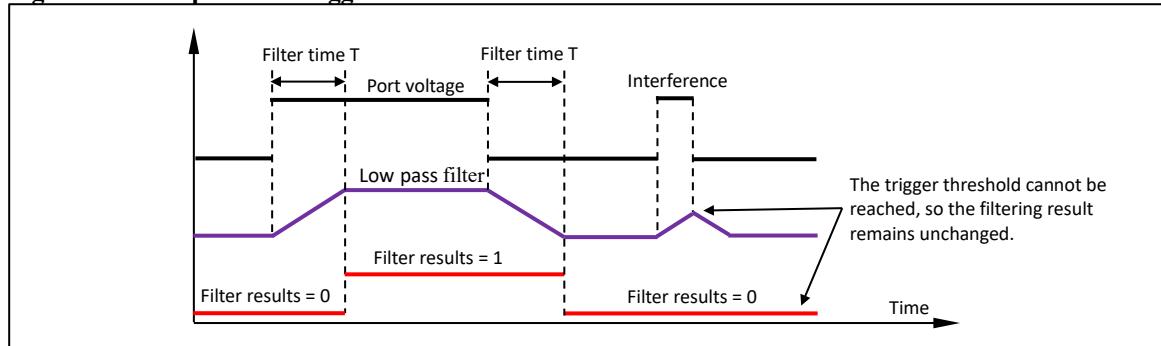

To use this mode of trigger, set “TG[i]=0”, i=0, 1 or 2.

- **Low Pass Filter Mode**

# Motion Controller with CAN Interface

In this mode, UIM342 performs digital low-pass filtering on the input and then collects the level changes. This can eliminate jitters and prevent interference from digital inputs.

Figure 4-2: Low-pass filter trigger

To use this mode, set “ $TG[i] = T$ ”,  $i=0, 1$  or  $2$ .

This instruction sets the filter time of IN  $i$  to  $T$  ([1 ... 60000] ms).

- **One-Time Trigger Mode**

In this Trigger Mode, UIM342 will process a port level change only once.

After that, the actions attached to the input port will be cleared and reset to none. User must set  $IL[i]$  again, in order to use the input logic again.

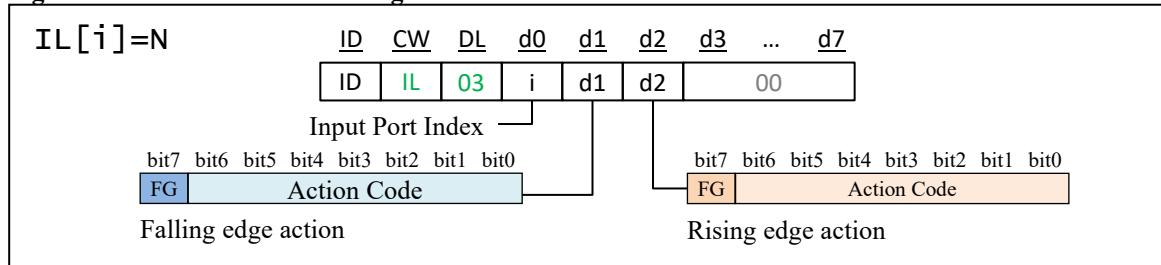

To use this mode, set “ $TG[i] = 60001$ ”,  $i=0, 1$  or  $2$ .

This trigger mode is useful in finding/setting the position origin, preventing the oscillation caused by repeated detection.

## 4.3 Configure / Attach Input Logic Action

Action attached to the input port  $i$  is configured by the instruction  $IL[i]$  ( $i=0, 1$  or  $2$ ), which is defined as follows:

Figure 4-3: Instruction to attach Logic Action

FG – Flag for Power-On Execution.

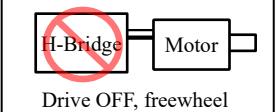

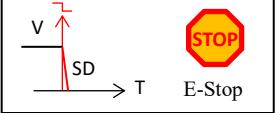

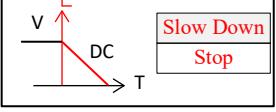

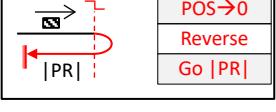

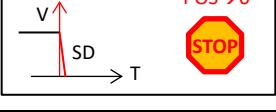

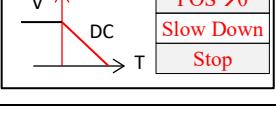

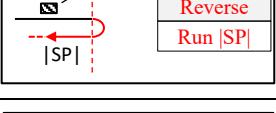

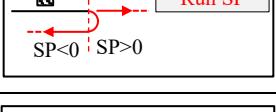

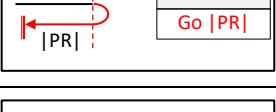

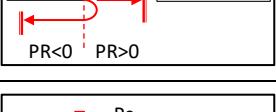

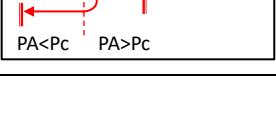

0 = Execute the action code automatically when power on, disregard the input logic level. This will create a power-on action.

1 = Prohibit Executing the Action Code when power on, until an input logic level change happened.

$i$  – Index of Input Ports.  $i = 0, 1$  or  $2$  represents IN1, IN2 and IN3 respectively.

Action Codes are listed below, that can be attached to the rising/falling edge of the inputs:

# UIM342C/UIM342S/UIM342XS

Action Code	Action Description	Illustration
0x00	No action	n/a
0x01	Turn the Motor Driver off, freewheel	 Drive OFF, freewheel
0x02	Emergency stop (using SD)	 E-Stop
0x03	Decelerating to stop (using DC)	 Slow Down Stop
0x04	Set origin then go reversed relative position (using  PR , SP, AC, DC)	 POS→0 Reverse Go  PR
0x05	Set origin then Emergency stop (using SD)	 POS→0 STOP
0x06	Set origin then decelerate to stop (using DC)	 POS→0 Slow Down Stop
0x07	Reversed Jogging (using  SP , AC, DC)	 Reverse Run  SP
0x08	Jog (using SP, AC, DC)	 Run SP SP<0 : SP>0
0x09	Go reverse relative position (using  PR , SP, AC, DC)	 Reverse Go  PR
0x0A	Go relative position (using PR, SP, AC, DC)	 Go PR PR<0 : PR>0
0x0B	Go absolute position (using PA, SP, AC, DC)	 Go PA PA<Pc : PA>Pc

## Motion Controller with CAN Interface

---

### 4.4 Real-time Notification for Input Change

When the logic level change on a specific input port is detected, there will be a real-time notification message sent to user. That message could be enabled or disabled by setting “ $IE[i]=1$ ” or “ $IE[i]=0$ ” respectively. Here,  $i=0, 1$  or  $2$  represents IN1, IN2 and IN3 respectively.

## **5.0 Instruction Set**

This chapter provides details of instructions supported by UIM342.

Note:

1. Unless otherwise specified, all message bytes are in hex format;
2. Examples assume that the UIM342 address is 5 (ID=5) ;
3. Abbreviation definitions as below:
  - a) INST – Instruction
  - b) ACK – Acknowledgment / Reply

# Motion Controller with CAN Interface

ACK	ID	CW	DL	d0	d1	d2	d3	d4	d5	d6	d7																																									
	05	17	00	00	00	00	00	00	00	00	00																																									
Note	Stop current movement, using stop deceleration (SD) to decelerate.																																																			

# Motion Controller with CAN Interface

## 5.13 MF Motion Parameter Frame

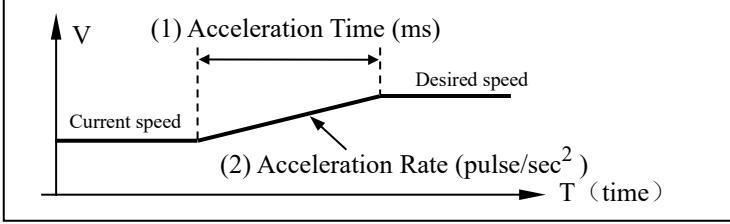

Motion Control

CW	Disable ACK	0x18	Request ACK	0x98								
DATA	unsigned 8 bit											
<b>MF=N</b> Set/select motion parameter group to be operated. INST data length    1    Data    d0 ACK data length    1    Data    d0												
Description	N	Description										
	0	Select the motion parameter group for normal operation										
	1	Reserved										
	2	Select the motion parameter group for the rising edge of IN1										
	3	Select the motion parameter group for the falling edge of IN1										
	4	Select the motion parameter group for the rising edge of IN2										
	5	Select the motion parameter group for the falling edge of IN2										
	6	Select the motion parameter group for the rising edge of IN3										
	7	Select the motion parameter group for the falling edge of IN3										
Example SET	INST	ID	CW	DL	d0	d1	d2	d3	d4	d5	d6	d7
					05	98	01	03	00	00	00	00
	Data d0 = 3 (Select the motion parameter group for the falling edge of IN1).											
	ACK	ID	CW	DL	d0	d1	d2	d3	d4	d5	d6	d7
					05	18	01	03	00	00	00	00
	Data d0 = 3 (The motion parameter group for the falling edge of IN1).											
Note	The UIM342 supports different motion parameter groups for preset actions triggered by different sources. MF=N provides a method to use same instruction (e.g. AC) to assign a motion parameter to different groups.											
	<p>The diagram illustrates the use of motion parameter groups for different inputs. It shows four sets of parameters (AC [0] to PA [0], AC [2] to PA [2], AC [3] to PA [3], AC [7] to PA [7]) each with 8 sub-fields. Arrows point from each set to one of three inputs: IN1, IN1, and IN3. Ellipses between the second and third sets indicate additional sets for other inputs.</p>											
	<ul style="list-style-type: none"> <li>For example, to set the acceleration of IN1 falling edge to 1000, using: MF=1; AC=1000; To get the acceleration of IN1 falling edge, using: MF=1; AC;</li> <li>After setting/getting a parameter, MF value will automatically reset to 0.</li> </ul>

# Motion Controller with CAN Interface

## 5.29 RT Real-Time Inform

Real-time Notification

CW	0x5A											
DATA	n/a											
Description	Refer to chapter 2.4 "Real-Time Status and Alarm Notification" for details.											
Example Message	ACK	ID	CW	DL	d0	d1	d2	d3	d4	d5	d6	d7

**Data d0 = 1** (Falling edge is detected on IN1).

# Appendix-1 RTU CRC16 Source Code

UIMessage uses CRC-16 (Modbus) algorithm. For details, please refer to Online CRC-8 CRC-16 CRC-32 Calculator ([crccalc.com](http://crccalc.com)) . The source code used in the calculation is listed below.

// CRC low byte table

```

unsigned char tblCRCLo[256] = {
